# **CS343 - Operating Systems**

**Module-7C** 

#### I/O Device Classifications and Performance

Dr. John Jose

**Assistant Professor** 

Department of Computer Science & Engineering

Indian Institute of Technology Guwahati, Assam.

http://www.iitg.ac.in/johnjose/

# **Objectives**

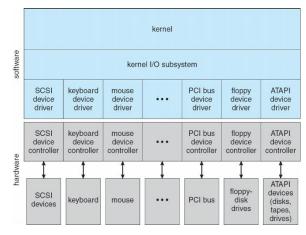

- Explore the structure of an operating system's I/O subsystem
- Discuss the principles of I/O hardware and its complexity
- ❖ Provide details of the performance aspects of various types of I/O devices

## **Application I/O Interface**

- ❖ I/O system calls encapsulate device behaviors in generic classes
- Device-driver layer hides differences among I/O controllers from kernel
- New devices use already-implemented protocols. No extra work.

❖ Each OS has its own I/O subsystem structures and device driver

frameworks

Kernel I/O Structure

### **Category of I/O Devices**

- Devices vary in many dimensions
- Character-stream or block
- Sequential or random-access
- Synchronous or asynchronous
- Sharable or dedicated
- Speed of operation
- \* read-write, read only, or write only

aspect	variation	example
data-transfer mode	character block	terminal disk
access method	sequential random	modem CD-ROM
transfer schedule	synchronous asynchronous	tape keyboard
sharing	dedicated sharable	tape keyboard
device speed	latency seek time transfer rate delay between operations	
I/O direction	read only write only read–write	CD-ROM graphics controller disk

# **Characteristics of I/O Devices**

- Broadly I/O devices can be grouped by the OS into
  - ❖ Block I/O
  - Character I/O (Stream)
  - Memory-mapped file access
  - Network sockets

#### **Block and Character Devices**

- Block devices include disk drives
  - Commands include read, write, seek
  - ❖ Raw I/O, direct I/O, or file-system access
  - File mapped to virtual memory and brought via demand paging
  - ❖ DMA
- Character devices include keyboards, mice, serial ports
  - Commands include get(), put()
  - Buffering and editing services

#### **Network Devices**

- ❖ Linux, Unix, Windows and many others include socket interface
  - Separates network protocol from network operation
  - Includes select() functionality to choose sockets for send and receive
- ❖ Pipes, FIFOs, streams, queues, mailboxes

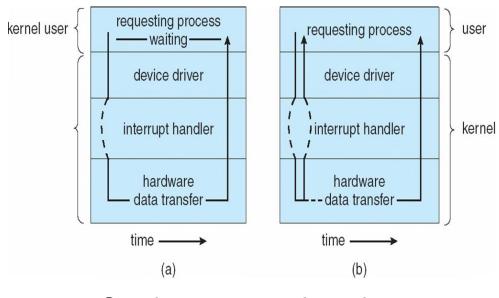

#### **Clocks and Timers**

- ❖ Provide current time, elapsed time, set a timer to trigger X and T
- ❖ Normal resolution about 1/60 second
- Some systems provide higher-resolution timers
- ❖ Programmable interval timer used for timings, periodic interrupts

## Nonblocking and Asynchronous I/O

- Blocking process suspended until I/O completed
  - Application from running to waiting and to ready states
- Nonblocking I/O call returns as much as available I/O data
  - User interface, data copy (buffered I/O)
  - Implemented via multi-threading
  - Returns quickly with count of bytes read or written
  - select() to find if data ready then read() or write() to transfer
- Asynchronous process runs while I/O executes
  - Difficult to use
  - ❖ I/O subsystem signals process when I/O completed

# Two I/O Methods

Synchronous

Asynchronous

# Kernel I/O Subsystem

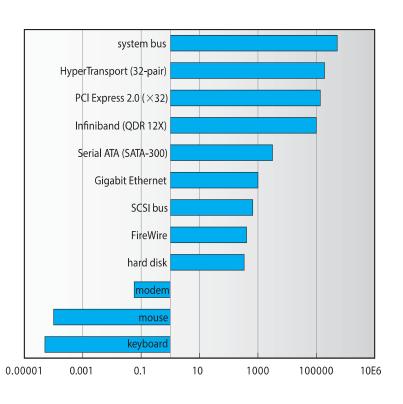

#### Scheduling

- ❖ Some I/O request ordering via per-device queue
- Some OSs try fairness
- Some implement Quality Of Service

## Kernel I/O Subsystem

- Buffering store data in memory while transferring between devices
  - To cope with device speed mismatch
  - ❖ To cope with device transfer size mismatch
  - To maintain copy semantics
- Double buffering two copies of the data
  - Kernel and user
  - Varying sizes
  - Full / being processed and not-full / being used
  - Copy-on-write can be used for efficiency in some cases

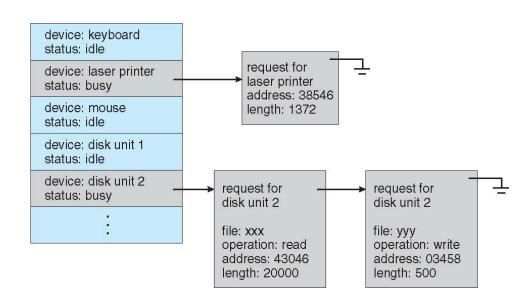

## **Sun Enterprise 6000 Device-Transfer Rates**

## Kernel I/O Subsystem

- Caching faster device holding copy of data
  - Always just a copy
  - Key to performance
  - Sometimes combined with buffering
- Spooling hold output for a device
  - If device can serve only one request at a time
  - ❖ i.e., Printing
- Device reservation provides exclusive access to a device
  - System calls for allocation and de-allocation
  - Watch out for deadlock

#### **Device-Status Table**

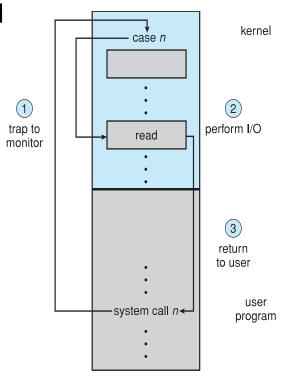

### **Error Handling**

- ❖ OS can recover from disk read, device unavailable, transient write failures
  - Retry a read or write, for example
  - ❖ Some systems more advanced Solaris FMA, AIX
    - Track error frequencies, stop using device with increasing frequency of retry-able errors
- ❖ Most return an error number or code when I/O request fails
- System error logs hold problem reports

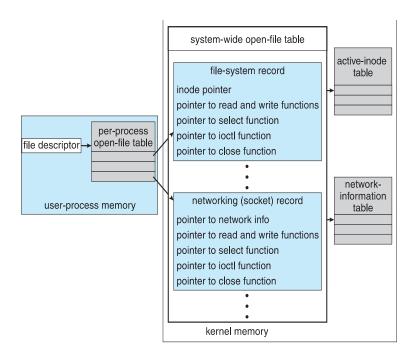

# **System Call to Perform I/O**

- ❖ All I/O instructions defined to be privileged
- I/O must be performed via system calls

#### **Kernel Data Structures**

Kernel keeps state information for I/O components, including open file tables, network connections, character device state

### **Power Management**

- ❖ Not strictly domain of I/O, but much is I/O related
- Computers and devices use electricity, generate heat, frequently require cooling
- OS can help manage and improve use
- Mobile computing has power management

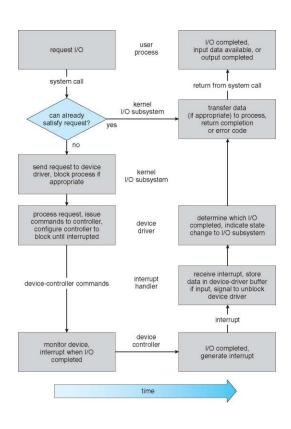

#### **Power Management on Mobile Platforms**

- Understands relationship between components
- ❖ Build device tree representing physical device topology
- ❖ System bus -> I/O subsystem -> {flash, USB storage}
- ❖ Device driver tracks state of device, whether in use
- Unused component turn it off
- ❖ All devices in tree branch unused turn off branch
- Wake locks like other locks but prevent sleep of device when lock is held
- ❖ Power collapse put a device into very deep sleep
  - Only awake enough to respond to external stimuli

# I/O Requests to Hardware Operations

- Consider reading a file from disk for a process:
  - Determine device holding file
  - Translate name to device representation
  - Physically read data from disk into buffer
  - Make data available to requesting process
  - Return control to process

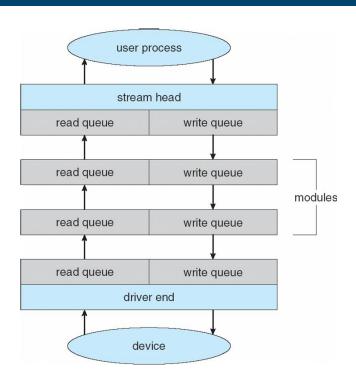

# Life Cycle of An I/O Request

#### **STREAMS**

- STREAM a full-duplex communication channel between a user-level process and a device in Unix System
- ♣ A STREAM consists of:
  - STREAM head interfaces with the user process
    - driver end interfaces with the device
    - zero or more STREAM modules between them
- Each module contains a read queue and a write queue
- Message passing is used to communicate between queues
  - Flow control option to indicate available or busy
- Asynchronous internally, synchronous where user process communicates with stream head

#### The STREAMS Structure

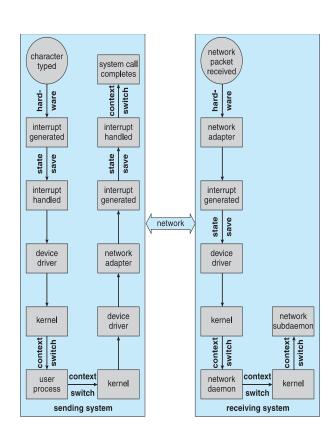

#### **Performance**

- ❖ I/O a major factor in system performance:
  - Demands CPU to execute device driver, kernel I/O code
  - Context switches due to interrupts
  - Data copying
  - Network traffic especially stressful

## **Improving Performance**

- Reduce number of context switches
- Reduce data copying
- Reduce interrupts by using large transfers, smart controllers, polling
- Use DMA
- Use smarter hardware devices
- ❖ Balance CPU, memory, bus, and I/O performance for highest throughput
- Move user-mode processes / daemons to kernel threads

## **Intercomputer Communications**
